

## **COVERT HARASSMENT CONFERENCE 2014**

### **THE WAYS TO DEFEAT THE SECRECY SURROUNDING THE EXISTENCE OF MIND CONTROL TECHNOLOGY**

Mojmir Babacek's lecture

In the past decade there is an obvious trend in the world politics to place the struggle for power above the struggle for democracy. This can be exemplified by the current situation in Ukraine. You probably know that in the recent elections the majority of eastern Ukrainians did not vote for parties promoting ukrainian membership in the European Union. All the same the democratic European Union and the democratic USA support the war of western Ukrainians against their eastern co-patriots while democratic Russia supports the eastern Ukrainians in the war against western Ukrainians. Isn't this an evidence that in the contemporary world democracy is not the priority for the power elites and financial entities behind them?

The issue of classification of mind control technologies is part of this favorisation of power above democracy. There would be no reason to hide those technologies from people if we were living in the world where democracy would prevail.

The fact that mind control technologies are classified is the reason why mind control technologies can be used on innocent people. The governments are perfectly aware of the fact that once the citizens know that their governments are in possession of technology which can be used to control citizen's thinking and bodily functions, the citizens would demand immediate and verifiable ban of those technologies. To know that governments are in possession of such technologies is to know that the democracy no longer exists. For that matter our effort to disseminate information on the existence of this technology among people is an effort to save democracy and the salvation of democracy can be defined as well as a goal of this conference.

For the victims of experimentation with those technologies, the classification of those technologies is the major obstacle on their way back to freedom and good health. Once the technology enabling remote control of human nervous system is declassified, the only possible follow up is the legislation banning the use of those technologies and establishing teams capable to measure and detect the harmful radiations and find their sources. The victims targeted by those radiations will be able to demand the verification of the use of those technologies against their persons and their torture will come to the end. The major problem is that so far only very few people are affected by those radiations and they have no chance to prevail in democratic process since they are small in numbers.

There are several ways to attract the attention of larger masses of people to the issue of mind control technologies and make the lawmakers and government officials work toward the ban of the use of radiations controlling the functioning of human nervous system:

The first approach is disseminating the convincing evidence on the existence of mind control technologies via Internet. There is certain amount of published scientific experiments proving that pulsed microwaves can produce effects in human nervous system including

auditory hallucinations and microwave hearing. This scientific evidence can be supported by information from the websites of ministries of defence of NATO states which are engaged in the development of non lethal weapons including radiofrequency weapons acting on human nervous system as is stated in the study of the European Parliament entitled Crowd Control Technologies

[http://www.europarl.europa.eu/RegData/etudes/etudes/stoa/2000/168394/DG-4-STOA\\_ET%282000%29168394\\_EN%28PARO2%29.pdf](http://www.europarl.europa.eu/RegData/etudes/etudes/stoa/2000/168394/DG-4-STOA_ET%282000%29168394_EN%28PARO2%29.pdf). For example on the site of the ministry of defense of the Czech Republic we can read: "High frequency electromagnetic radiation. disrupts the activity of the brain and the central nervous system. The effect is perceived by the individual at the same time as an unbearable painful sensation of intense hum and squeaking accompanied by anxiety and uneasiness depending on the precise conditions and parameters of the signal". Apparently in order to hide this information from the Czech public this article is no more accessible directly from the webpage of the Czech ministry of defense, though you can still find it on the site of the ministry, if you know the exact address of the article <http://www.army.cz/scripts/detail.php?id=2212>. Further evidence for the fact that at least certain governments are in possession of mind control technologies can be found in political actions aimed either at the ban of mind control technologies or at their military use.

Russia was proposing the ban of radio wave weapons which it considered to be weapons of mass destruction in the U.N. Committee on Disarmament already in 1986. The only negative vote on the committee cast the USA and so those weapons were not banned. In 1998 Russia addressed the United Nations, OSCE and the European Council with a proposal for an international convention banning the development and use of informational weapons. Until that point of time there were presented four bills proposing the ban of mind control technologies in the Russian parliament. The European union cooperated with Russia in the following year and in 1999 the European parliament passed the resolution calling for the ban of manipulation of human beings. Evidently Russia and the European union cooperated in order to prevent advances in the construction of the American system HAARP which apparently can be used to manipulate nervous systems of whole populations. It seems to be rather evident that the convention banning the development and use of informational weapons was not signed again due to the resistance of the USA. Quite to the opposite they managed to convince the countries of the European Union to accept the development of non-lethal weapons into their military doctrines and abandon their effort to ban mind control technologies. In 2001 Dennis J. Kucinich opposed the decision of the U.S. government to keep their mind control technologies and presented in the U.S. Congress the Space Preservation Act bill demanding among others the ban of those technologies. However his effort did not last long. After the long silence on this issue in 2012 Russia, facing the danger that its nuclear weapons will no more pose a threat to the USA, choose the opposite path of action and the Russian defense minister declared that psychotronic weapons are part of the Russian state arms procurement program for the period from 2011 to 2020 [http://en.rian.ru/military\\_news/20120322/172332421.html](http://en.rian.ru/military_news/20120322/172332421.html).

Those actions of governments and members of parliaments together with above mentioned scientific publications present convincing evidence that devices enabling remote manipulation of human body's functions and brain activity actually exist.

The trouble is that if you gather this kind of evidence and publish it on Internet, since no big media dare to publish classified information, your publication on Internet is targeted by

government agencies. For example when I published the article How Far in the Future is the Ban of Psychotronic Weapons, messages referring to my international webpage were blocked on Facebook as spam and on Twitter as malware and finally both my webpages (in Czech and English language) containing this information were deleted from Internet. The western and especially American secret services apparently did not want to allow to happen, in a western hemisphere, an event comparable to the Arab Spring.

We would need a systematic work to expose this activity of government agencies to the Internet public. It would mean to record with a camera the sites with this information when they are placed on Internet and as well to record with a camera when they are no more available or when the reference to them is blocked on Facebook or Twitter. The video, proving this work of government agencies should then be placed together with a new webpage address of the text in question on YouTube and the whole story should be described in articles published on Internet. To avoid a repression by the state agencies this work should be done not by only one person, but by a group of people. This would be the way to make masses of people aware that the state agencies are hiding from them their possession of technologies enabling remote control of human mind and body. If anyone wants to take part in this effort, please write me at the address [mbabacek@czin.eu](mailto:mbabacek@czin.eu).

Second way to fight the secrecy surrounding weapons enabling remote control of human nervous system is to inform the deputies of parliaments about the existence of those technologies. Most of them apparently do not have security clearances to obtain this kind of information. I have talked to two deputies of the Czech parliament and evidently none of them was aware of the possibility of remote control of the functioning of human nervous system. Yet evidently when they are not aware of the existence of mind control technologies, they do not feel the obligation to implement the ban of their use. Anyway we know that deputies do not care for the issues about which the general public does not care. So the public pressure for the ban of mind control technologies is needed to make the deputies feel obliged to work toward this goal. The MP's should be addressed individually and we should make sure that they have received the information and citizens should be made aware which MP's were informed. Again this could be done only by an organized group of people and this should be the same group of people who would try to inform the general public. A list should be established on Internet dedicated strictly to this effort.

The third way how to make the governments and legislative bodies enact the legislation banning the mind control technology and establish teams capable to detect those harmful radiations is to present the evidence of the feasibility of this technology to constitutional courts and demand them to suggest the verifiable ban of development, possession and use of technologies enabling remote manipulation of human nervous system. The problem is that constitutional courts usually are not authorized to suggest new legislations. At least in the Czech Republic the constitutional court does not have this right so far. The only way around it is to file a lawsuit in the regular court and if it denies the action than challenge its decision with the constitutional court. The trouble is that to file a meaningful lawsuit we need an irrevocable evidence. Hopefully it can be acquired it with the use of various detection devices.

The irrevocable evidence is the evidence developed in a scientific way. Most of the detectors available on the market are capable to detect frequencies up to 8 GHz. Most

scientists experimenting with effects of pulsed microwave radiation on human brain came to a conclusion that carrier microwave frequencies above 3 GHz do not have any effects. The reason is that the higher the microwave frequency is the faster it is absorbed in the human tissue and for that matter it does not penetrate deep enough into the brain to produce there any effects. All the same there are windows at frequencies above 3 GHz where the electromagnetic waves will penetrate deep enough into the brain tissue to produce effects on nervous system. Among those frequencies are frequencies of the red light and near infrared light. Red light, with wavelength from 620 to 750 nanometers, penetrates, about 1 centimeter deep into the brain tissue and is capable to affect about one quarter of the brain gray matter. Near infrared light with wave lengths between 700 and 800 nanometers penetrates normally 3 to 4 centimeters deep into the tissue <http://www.nirtherapy.com/penetration.php>, but when the geometrical shape of a wave of near infrared light is changed this light can be made to penetrate up to 20 centimeters deep into the human tissue. The fact that red and near infrared lights penetrate into the human tissue is explained by the fact that the average wavelength of the activity of cell tissue in the human body ranges between 600 nanometers and 720 nanometers <http://www.elixa.com/light/healing.htm> which match frequencies of red and infrared light. There are studies suggesting the ability of near infrared light to affect the activity of nerve fibres <http://www.revitavet.com/CaseStudies/MechanismsActionInfraredLightTissueHealing.pdf> (pg.6).

To make human nervous system more susceptible to be controlled by pulsed frequencies of light no microchips are needed. The scientists developed viruses which can make neurons susceptible to react to pulsed frequencies of light [http://www.realclearscience.com/blog/2014/01/optogenetics\\_the\\_physics\\_of\\_mind\\_control\\_108437.html](http://www.realclearscience.com/blog/2014/01/optogenetics_the_physics_of_mind_control_108437.html). So now to make a human being susceptible to manipulation of his nervous system you only need to make him eat some contaminated food or to undergo a vaccination. Just two examples: one of the pioneers of this research Gero Miesenbock cut off the head of a fly and than used the pulsed light to order its body to fly and it did fly [http://www.sciam.cz/files/vydani/SA\\_03\\_2010/brezen\\_2010\\_rozsveceni\\_mozku.pdf](http://www.sciam.cz/files/vydani/SA_03_2010/brezen_2010_rozsveceni_mozku.pdf). Another one, Carl Dienesroth, made the mouse to run making only left turns with the use of pulsed light <http://www.youtube.com/watch?v=88TVQZUfYGw>.

However red and near infrared lights do not penetrate walls and other optical barriers [http://paginas.fe.up.pt/~ee05005/tese/arquivos/wireless\\_ir\\_com.pdf](http://paginas.fe.up.pt/~ee05005/tese/arquivos/wireless_ir_com.pdf) and for that matter could not be used for continuous manipulation of human nervous system. As well the red light is visible and could be detected rather easily. There is a question whether the same viruses which could make neurons react to light will make them react to microwave frequencies from 100 Megahertz to 3 Gigahertz, which penetrate into human brain. If they will not, most probably, there is no problem for contemporary science to develop viruses which would make neurons react as well to microwave frequencies.

The frequencies of near infrared light, which is invisible, can be detected by special detectors <http://www.gigahertz-optik.de/272-0-RW-3702.html>. As well there is a question whether wave shapes of frequencies above 3 GHz could not be doctored up to make them penetrate into human tissue. On Internet detectors for frequencies used by NATO (20 - 40

GHz) can be found <http://www.bestbuy.com/site/whistler-laser-radar-detector-black-black/1307396490.p?id=mp1307396490&skuld=1307396490>.

Anyhow extensive experimentation with the available devices should be carried out in search of the evidence of the use of so called "psychoactive" pulsed microwave frequencies on human beings. If it is found, it should be presented to media and courts. Such evidence should be sufficient reason for them to demand the legislation banning the possession and use of mind control technologies to private persons as well as to organizations and government agencies. It is obvious that media as well as the courts will want to verify this evidence at the scientific laboratories. For that matter it is worth effort to ask scientific laboratories for the verification of this evidence even before it is presented to the media or courts. Many scientists are kind people and when facing convincing evidence recorded on video they may be willing to verify it using their precise equipment.

Now what convincing evidence means. According to various studies the power density of electromagnetic radiation in the cities is most of the times no more than 5 microwatts per square centimeter. However in an Indian city the measurement reached 1mw per square centimeter. Most scientists, who experimented with the effects of microwave radiation on human organism agreed that the necessary power density does not exceed 10 mW/per square centimeter. In the experiment by Allen H. Frey with microwave auditory effect the average power density varied for different frequencies and pulse widths from 0,4 mW per square centimeter to 7,1 milliwat per square centimeter. In Ross Adey's experiments with calcium efflux from nervous system, the efflux occurred only within the range of power density from 0,1 to 1mW per square centimeter or in other units he had the best results when using the intensity of electromagnetic field of 10 V per meter and 56 V per meter. For the fact, that power density of mind control frequencies is close to electromagnetic smog in the cities it is advisable to make the measurements of power density outside of cities. The measurements should be made as far away from the cell phone antennas as possible and away from power lines underneath which the intensity of electromagnetic field may reach 100 V per meter and as far away as possible from high voltage power lines underneath which the intensity of electromagnetic field may reach 10.000 V per meter. The measured person should be approaching the measuring person from distance so that the measuring person could see and record on video camera whether the power density is rising with the approaching measured person. The experiment should be repeated several times. The device for measurement in Volts per meter of intensity of electromagnetic fields in frequencies from 5 Hz to 400 KHz (with accuracy 1 microwatt per square centimeter) and power density of electromagnetic fields in frequencies from 300 Megahertz to 2000 Megahertz (2 Gigahertz) in milliwats per square centimeter can be found on Internet as Electromagnetic radiation detector DT-1180 and can be bought for 21 U.S. dollars.

As for frequency counters it is rather impossible to find evidence of microchips in the city as well as outside of the city due to the overwhelming presence of electromagnetic waves in the modern environment. But there are caves or ancient mines accessible to the public, where electromagnetic waves in microwave frequencies do not penetrate. Personnel at those sites does not object to performing measurements at their facilities. If the chip is not getting its energy from the outside antenna, it should be working still when it is in the cave or mine. It should be measured by frequency counter (the frequency counter Aceco FC-6002

Mk2 registering frequencies up to 6 Gigahertz can be bought for 149 euros) as well as by a device measuring the power density and the measurements should be recorded on the camera. The measurements should be repeated on the same spot in absence of the measured person and on a person which is not claiming to be targeted by brain control radiation and they should be repeated several times in front of the camera. The video recordings should be then presented to scientists who have access to electromagnetically shielded rooms and they should be asked to verify the presence of the chip with their equipment. The scientific evidence should be then presented to the media and courts. (To save money one could start with buying only the Electromagnetic radiation detector). If anybody finds the evidence I would be glad if he lets me know at the e-mail address [mbabacek@czin.eu](mailto:mbabacek@czin.eu) .

There is one more experiment which could be worth effort, though it would not bring out any objective evidence. It should be tried how much the experience of a person who claims to be targeted would change when the magnetic field in which it is situated changes. When Ross Adey carried out his experiments with calcium efflux from neurons, other scientists found out that they had to use different frequencies of microwave pulses than Ross Adey to obtain the same results. When searching for the reason of this phenomenon, they found out that those were the variations of the strength of the magnetic field of the Earth at the locations of their experiments which were responsible for the variations in effective pulse frequencies in their experiments. Finally Ross Adey placed next to chicken brains he was experimenting with a Helmholtz coil, which cut in half the Earth magnetic fields. Now to cause the efflux of calcium from neurons he needed instead of pulse frequency of 15 Herz a frequency of microwave pulses of 30 Herz. The explanation for this phenomenon is the cyclotron resonance. For that matter it would be important to see if the experience of a targeted person would change in the presence of a strong artificial magnetic field or Helmholtz coil. In the 70's of the past century the hair dryers helmets produced magnetic fields of about 30 Gauss. The strength of the Earth magnetic field varies from 0,25 to 0,65 Gauss). If the current hair dryers helmets still produce strong magnetic fields it would be worth effort to see if the experience of a targeted person would change, when it is drying its hair in the helmet (If not it would be worth a try to buy someplace the old helmet). If the experience of several persons claiming to be targeted would change due to the effect changed Earth's magnetic field this would be a definitive proof that those persons are subjected to the effects of pulsed microwave radiation and the only remaining problem would be to find the carrier frequency used against those individuals (if anybody tries it, please let me know the results at the address [mbabacek@czin.eu](mailto:mbabacek@czin.eu) ). Another way to experience a strong artificial magnetic field would be to undergo examination with magnetic resonance which usually lasts more than half an hour. Solenoid would work as well.

I believe there should be a list created on Internet dedicated strictly to scientific research concentrating on the possibility of the use of pulsed electromagnetic waves against people.

Some eight years ago I have seen on Internet a proposal by Chinese scientists to develop a direct brain to brain communication with the use of the concept of non local electron and photon connection. You probably know that this concept of quantum physics states that when two electrons or photons make an encounter, ever since their reactions are coupled no matter how far away they are from each other. It sounds quite feasible that if the photons and electrons in two brains or in a brain and a neurocomputer are made to meet,

the two brains or a brain and a neurocomputer will become intertwined. As we have seen in this lecture the near infrared light can be made to penetrate 20 centimeters deep into the brain. Perhaps this could be the way how to make acquainted the photons in two brains and interconnect one brain with the other brain or with the computer simulating brain activity. I am aware that to detect such a malicious act by some government organization is rather impossible once it was done. I wonder whether the weapons using unknown physical concepts, the development of which the Russians recently announced, include this concept. The possible defense against this kind of manipulation of human brain could be the replacement of "acquainted" photons in the brain by new photons by means of a long exposure to near infrared light. If anybody tries it, it would be worth effort to get the near infrared light generator generating the light penetrating 20 cm deep into the tissue (with adjusted wave shape). He should as well make sure that it does not generate near infrared light which is warming up the tissue and could cause him a brain damage. The near infrared light is warming up the tissue only by 0,2 degree Celsius. If anybody tries this method, please let me know the results at the e-mail address [mbabacek@czin.eu](mailto:mbabacek@czin.eu) .

To conclude my lecture I would like to stress one more time that in the modern times, with incredible advances the science and technology are making, the ban to access human brain by various radiations from the part of governments or malicious organizations or individuals should be embedded in constitutions of all of the countries of the world. Otherwise the concepts of independence of a human being and democracy will be destroyed.

At present time the major obstacle to reaching this goal is the effort of the USA and its financial and corporate elites to reach global power instead of sharing it with Russia, the European union and other democratic countries as well as with China. If the human world is supposed to have any humanistic and democratic future the struggle for world dominance by individual governments must be stopped.

**Advances in the detection research will be published on Stopeg Foundation website**
